Medallion Architecture Basics

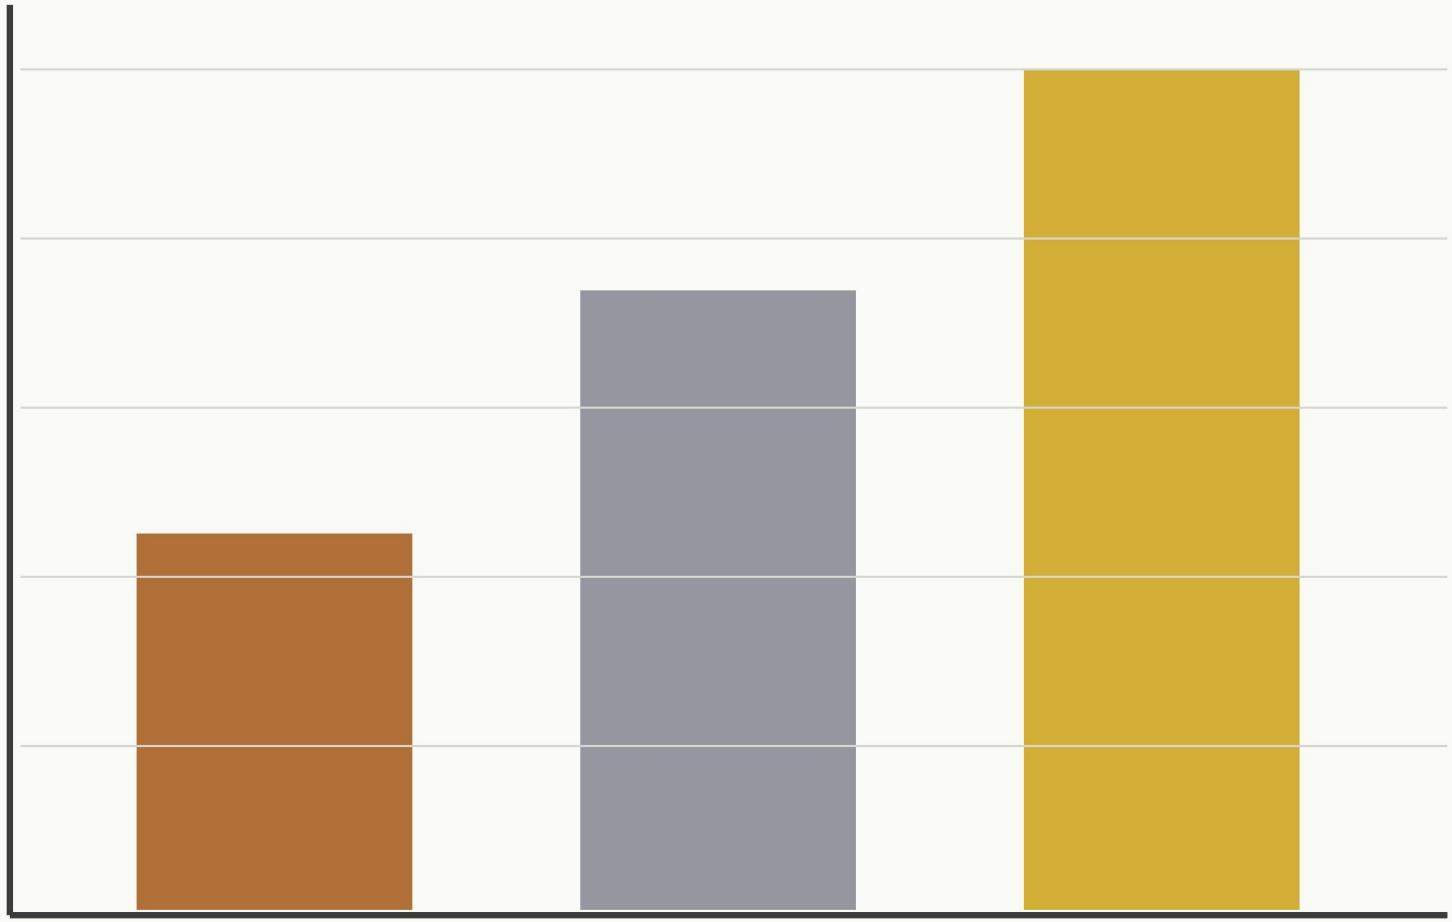

Synthetic fixture deck for parse-layer tests

Three Layers

- Bronze keeps raw data exactly as it arrived
- Silver holds cleaned and deduplicated records
- Gold serves business-ready aggregates

Data Flow

A Silver Model in dbt

```
SELECT order_id,
       customer_id,
       CAST(amount AS NUMBER(10, 2)) AS amount
FROM {{ source('shop', 'raw_orders') }}
WHERE status IS NOT NULL
```

Summary

- Keep bronze unchanged for replay
- Clean once in silver
- Aggregate for consumers in gold
